

CONTEXT RESEARCH

HACKNEY ARCHIVES

Looking for photographs of how the Eastern Curve Railway used to look like or how people navigated the space

I could only find pictures of the place from the early 2000s when the railway was still abandoned

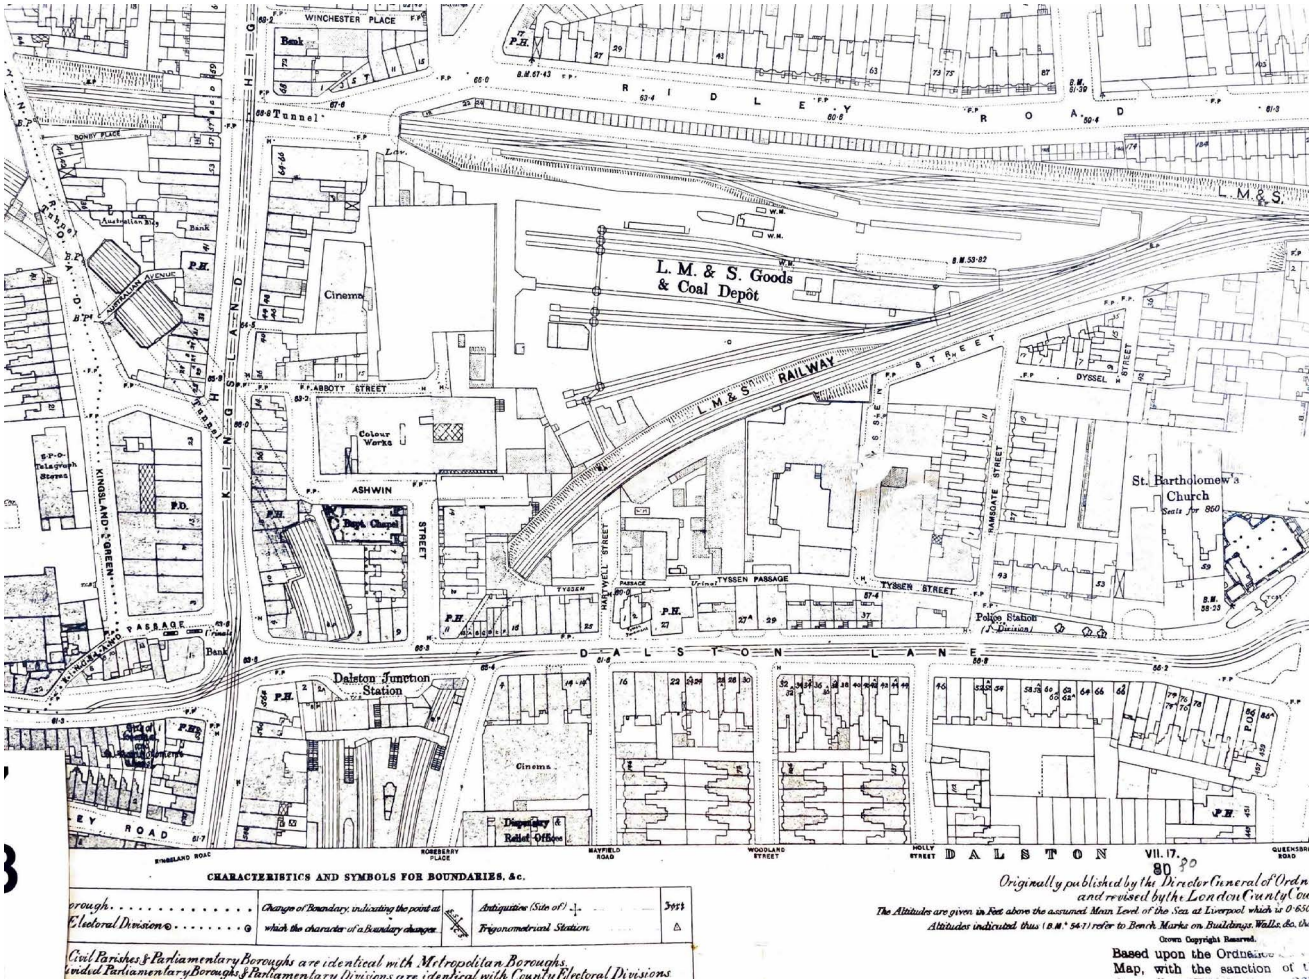

However, I did find maps of the area dated back from 1870 until 1912

In the map I could spot three things relevant to my process

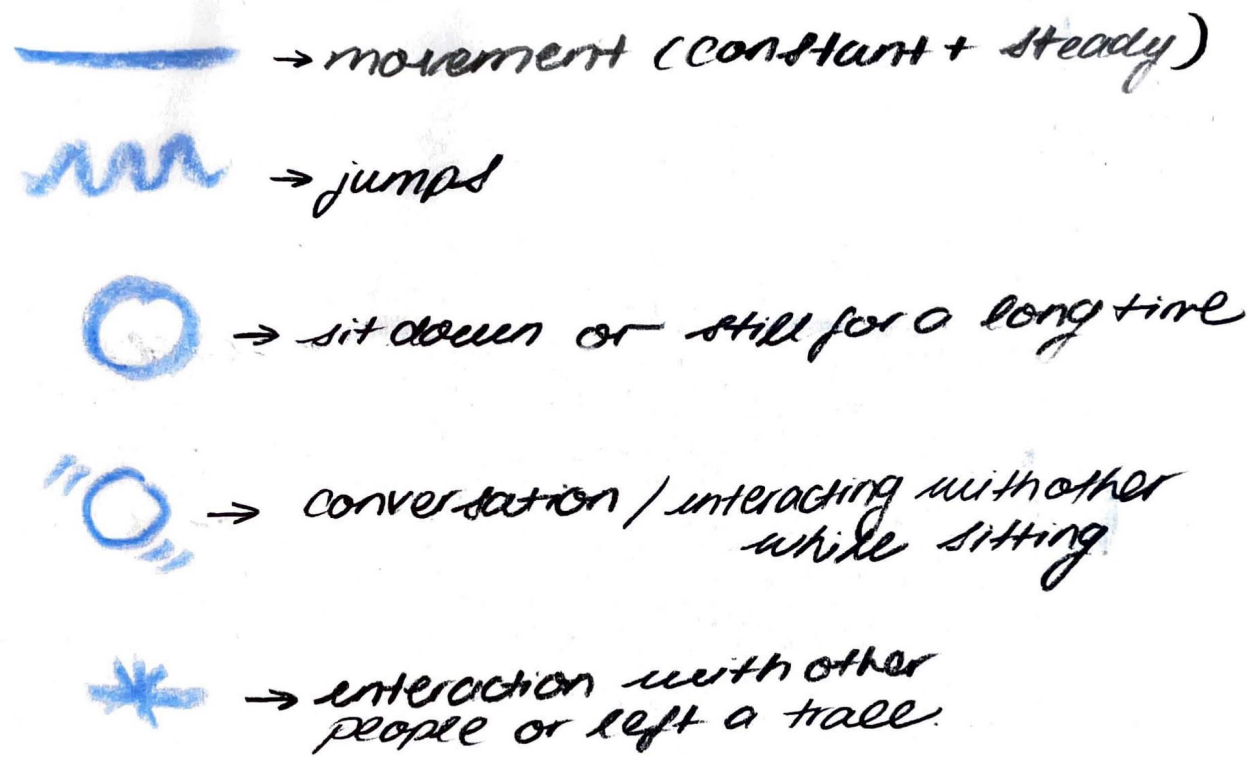

- the curved was disused
the tunnel is no longer signaled
- the train network has out grown
- housing and urban buildings have been contrstcted all around the area
- the green public spaces marked by tree are no longer mapped.

When mapping trains, lines also imply movement.

HOW CAN I ITERATE PEOPLE MAPPING, WHILE
GIVING EACH MAP MORE IDENTITY?

I outlined some conventions for some
of the type of movements.

It was hard to assign symbols to different types of movements before starting the mapping process, these were some of the typologies I proposed

#3 reflection

Some decisions come by thinking through the method / while doing the first maps

/METHOD adjustments

thursday

#3

The most proper typologies for walking slow & running came through mapping itself.

I also started mapping other people that intervened with the movement map I was doing.

Also I accompanied maps with note-taking of some of the activities people were doing.

#4

I felt that the identity in the map was still missing. I added some illustrations of the objects or characteristics that were representative of the person I was mapping.

2 friends (women)
late 20 - early 30

Sharing a drink
Coffee + glass bottle
water
Phone over table
with headphones
(wire)

They leave their things
next to the kids' area
& run to the toilet

Mum + 6-7 year old L.
Kid runs in.
Mum carried small bike

asked for a
opposite &
a lighter
looked where
to sit.
chose a bench
on side-
dressed &
leaved.

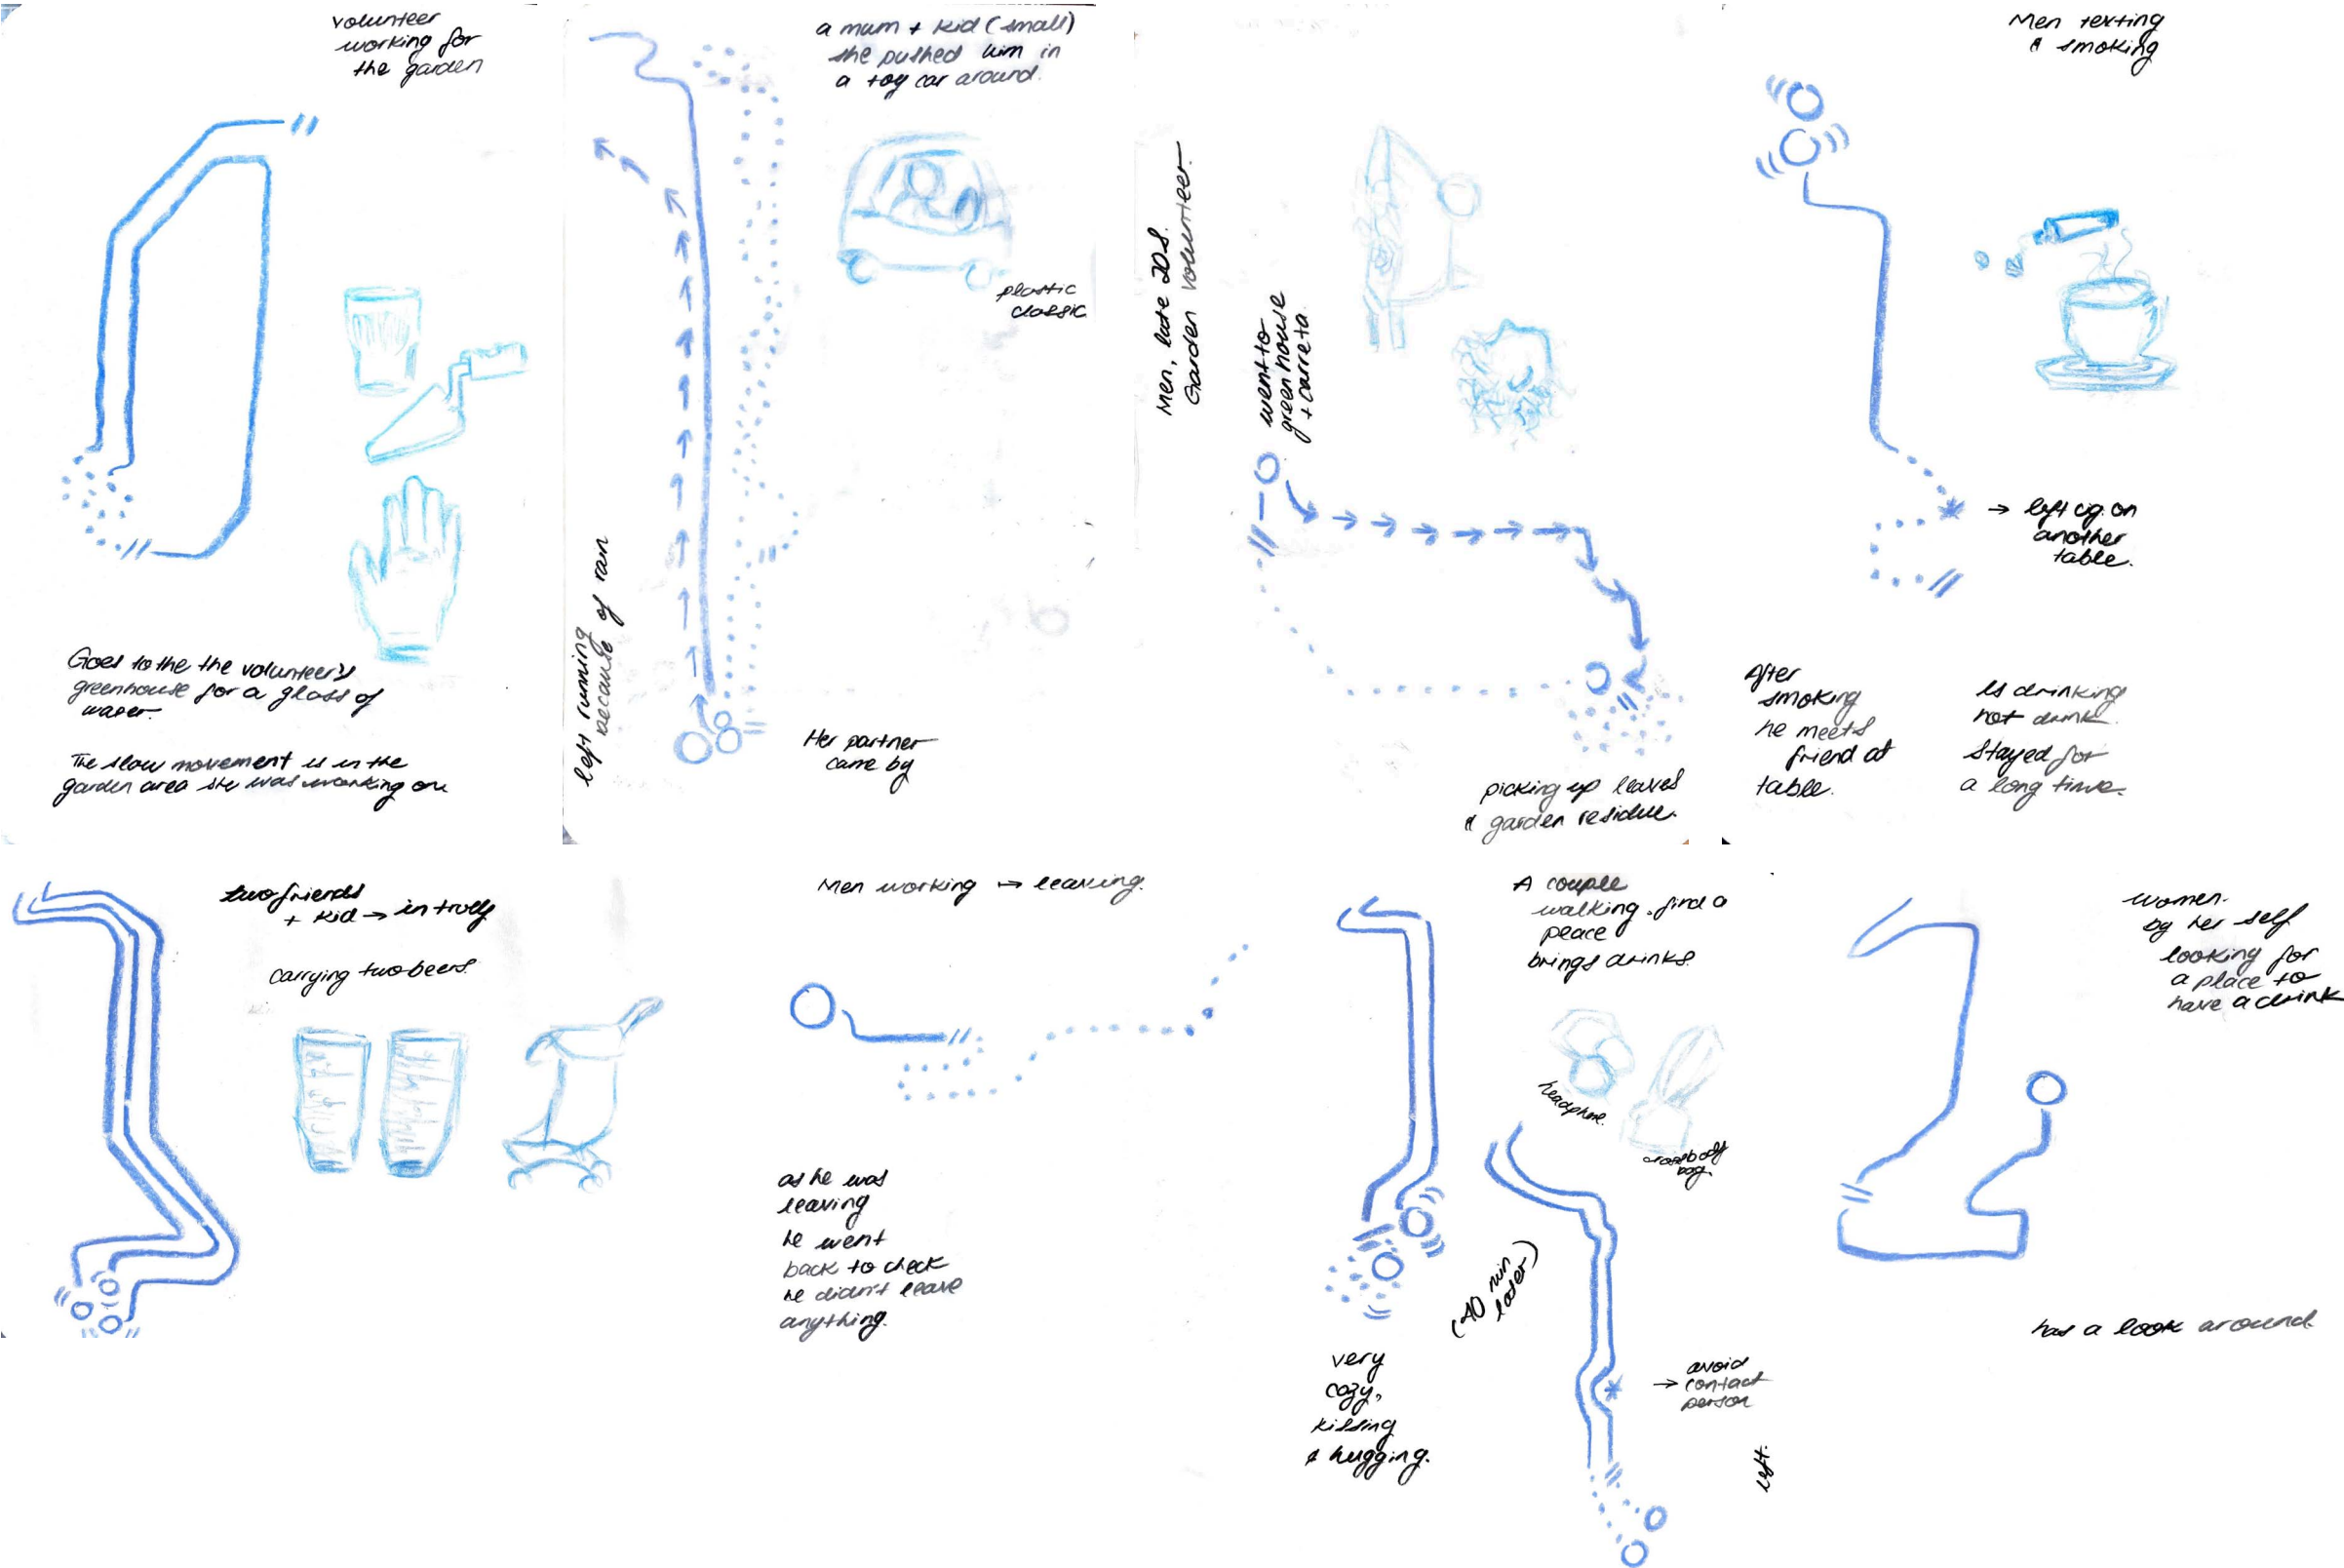

vanessa
02 pm and

7-8 y/o boy
running toward
park

/METHOD
adjustments

friday

#5

Illustrating wasn't giving me any new insights, and it was distracting from my focus on iterating the mapping process.

I went back to mapping but adding more detail through notetaking about the person and their movement

they had 3 beers together

/METHOD adjustments

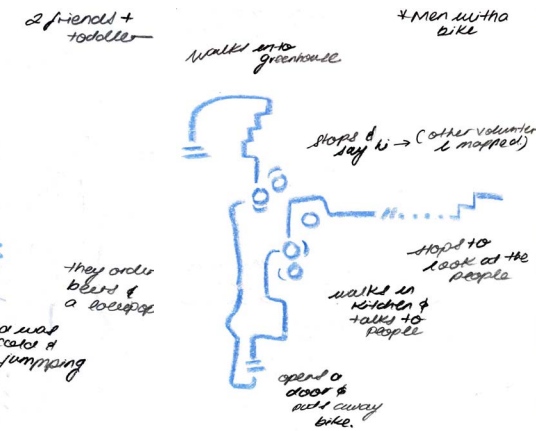

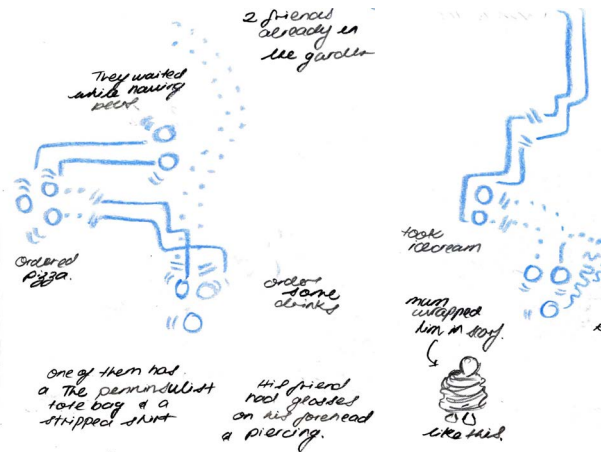

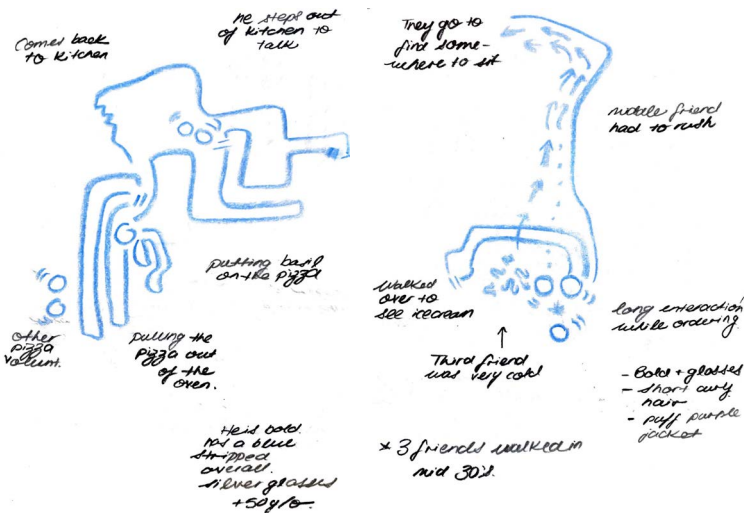

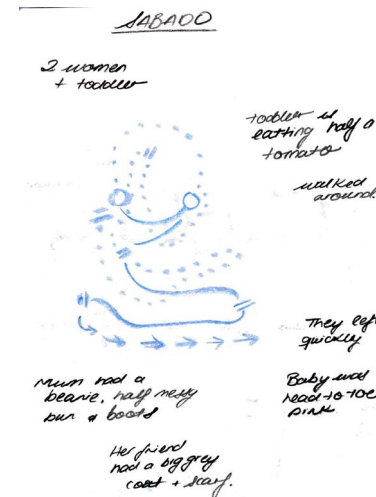

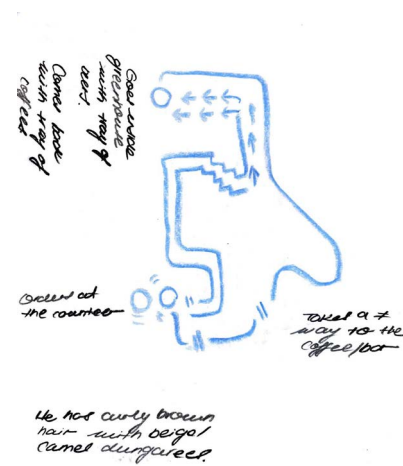

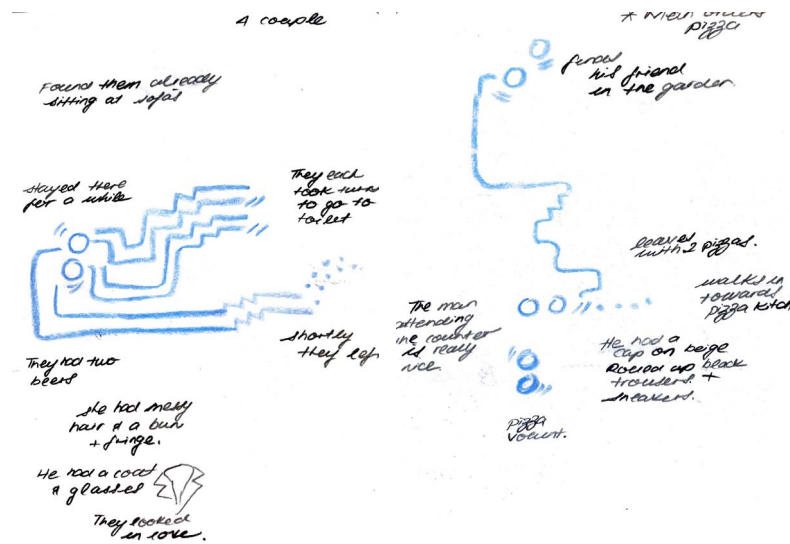

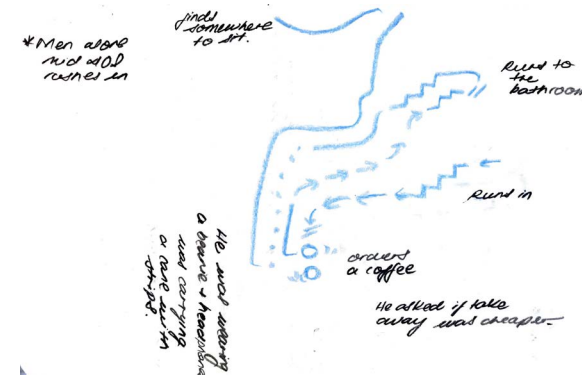

saturday

#6

I changed the view from where I was mapping to test if I could obtain more information

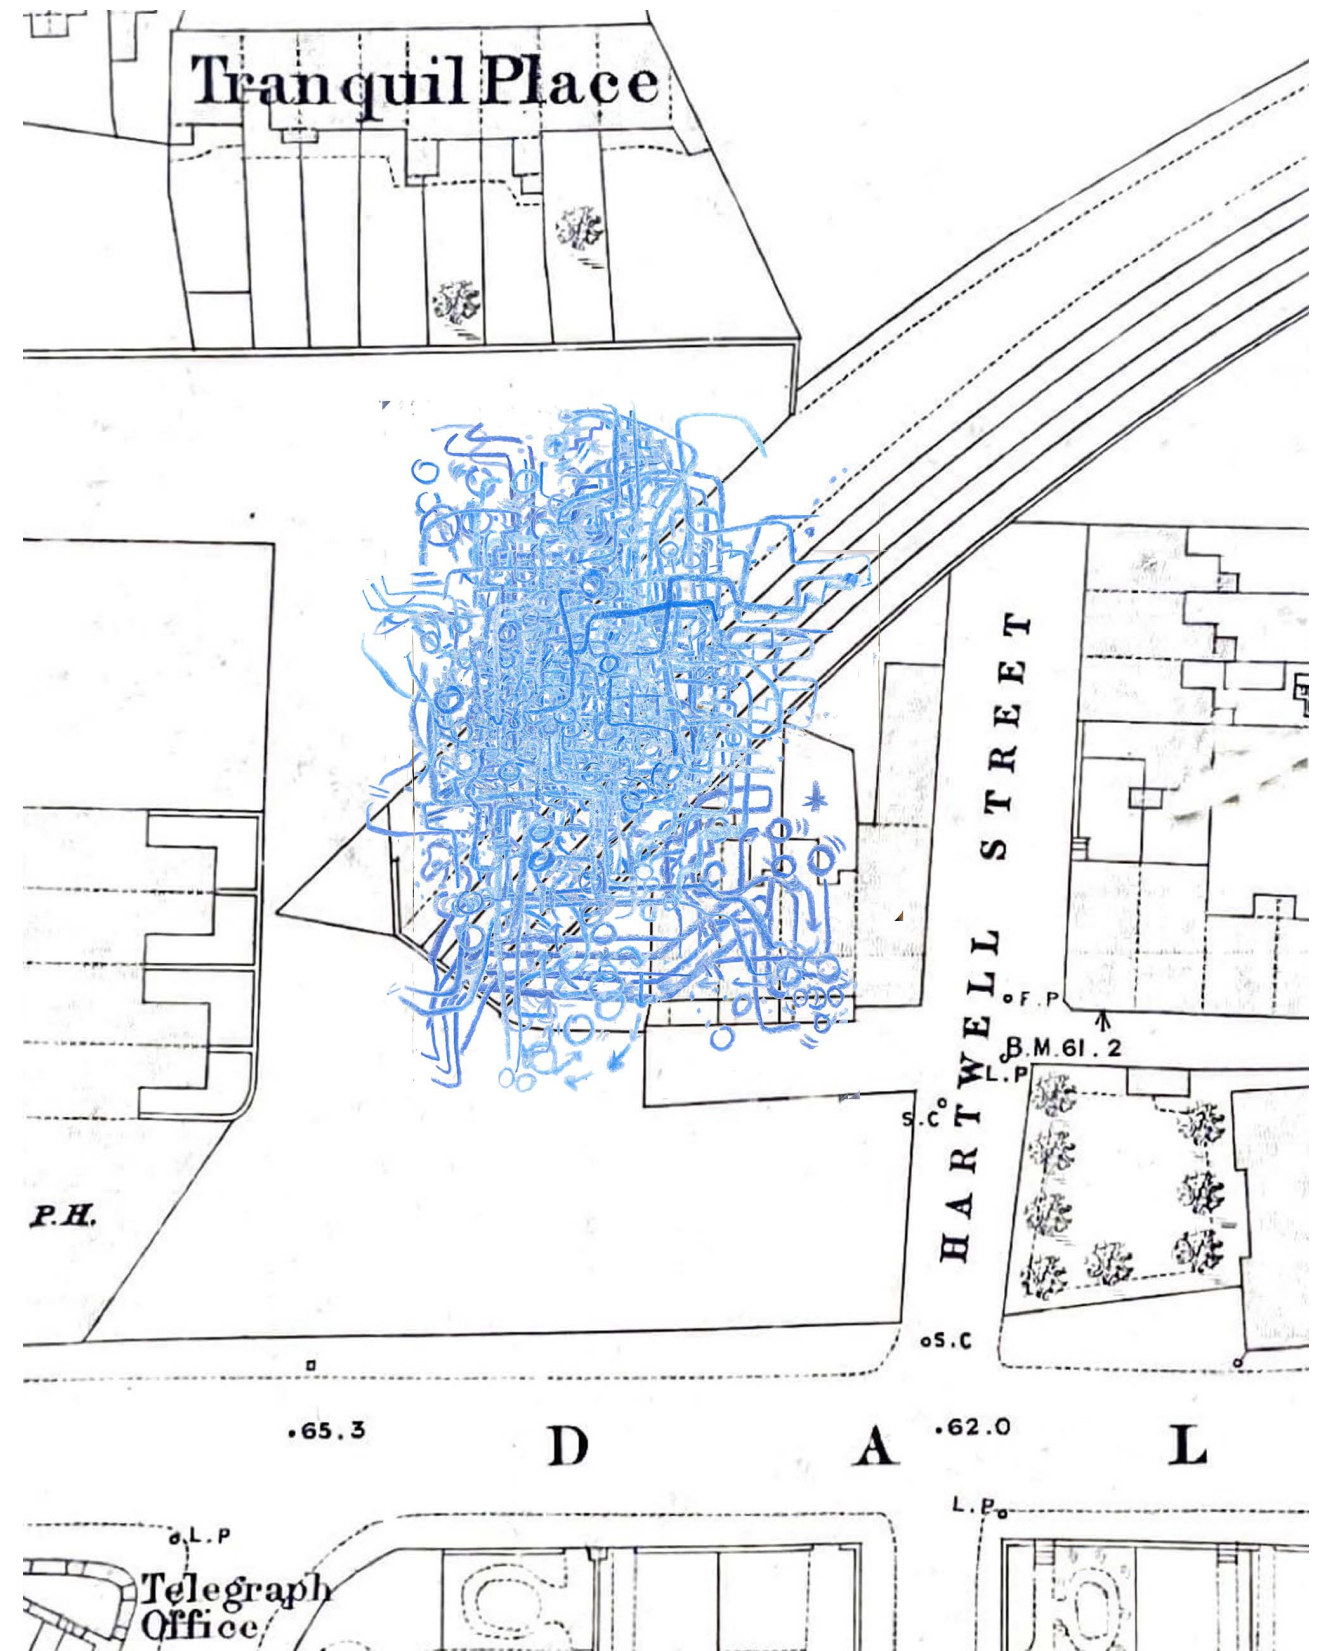

I also followed people for longer, so I could develop a more complex trail of thier movement and interaction.

I tried to have notetaking about people's interaction, moves and physical apperance.
--> more organic

I overlay the maps on top of the railway was still working in the place. But apart from giving the maps a context and a espacial placing, overlaying them isn't very helpful

However, when I put the individual maps together it made me realized that it is interesting how the maps create an imprint of the place everyday

I created a short animation of how each movement maps starts to build up daily.

#final reflection

Every maps become a particular print of the estructures that take part and shape the garden every day.

This method becomes allows me to map human landscapes that are always at flux as non-static infraestructures

Through this movment maps I capture the imprint of the people and activities that intervine daily gighlighting how important intangible relationships are as systems that condition how we understand and navigate a space.

SATURDAY

WHICH METHOD IS THE
MOST INSIGHTFUL

Mapping - It allows me to visualise the human network that unfolds inside Dalston Curve Garden. With mapping I can record people, how they interact with the space and each other.

I decided that mapping is the method most relevant and insightful because, visually it translates into a web of streets and connections just like any transport or building infrastructure would look like. This way I can highlight how important intangible relationships are as systems that determine how we understand and navigate a space.

INSIGHT

Many years later the same place is still a space that connects the neighbourhood. The network, before train-lines, transformed into human interactions, is now the infrastructure that maintains this place, and the community's involvement is vital in shaping it.

HOW DOES THIS CONNECT
WITH THE PLACE

Dalston Curve garden used to be an old railway curve until the early 1900s. Railways were (and still are) an important asset that connect people, and places.

After being abandoned, and turned into a garden in 2010, people became the infrastructure that connected the community. Not only by looking after a public green space (in a borough with few public parks), but through workshops, and activities that support the communities needs.

But this human imprint is not always visible. Mapping as a system allows me to visualise the multiple relationships, experiences, activities and individuals that overlap and change daily. Hence interactions reshape constantly how we use and perceive the garden. Just like Dalston curve, this can be applied and used to investigate the relationships that build any other site.
